

How to balance forestry, biodiversity conservation and other ecosystem services?

Dr. Frank Krumm, Swiss Federal Institute for Forest, Snow and Landscape Research WSL

What are the challenges on the operational level?

- > Managing ES in a changing environment needs to consider trade-offs, synergies and potential conflicts.
- Substitute species need to fulfil different aspects: Being able to live and adapt to future climate (drought, frost, fire, ...) -> Being resistant against upcoming biotic risks
 - Guarantee relevant ES
- > Decision to introduce non-native tree species needs to be carefully evaluated in the context of expected changes in environment and societal needs.
 - Respect diversity and avoid uniformity in general!**
